

START USING DOCKER RIGHT NOW

AGENDA

- What is Docker?
- Architecture
- How it's works?
- Innovation
- Demo

WHAT IS DOCKER?

- Was released in March 2013 (OSS)
- “New Age” of virtualization: *containers*.
- Allow independent containers to run on a single Linux instance.
- Uses the resource isolation feature of Linux kernel.

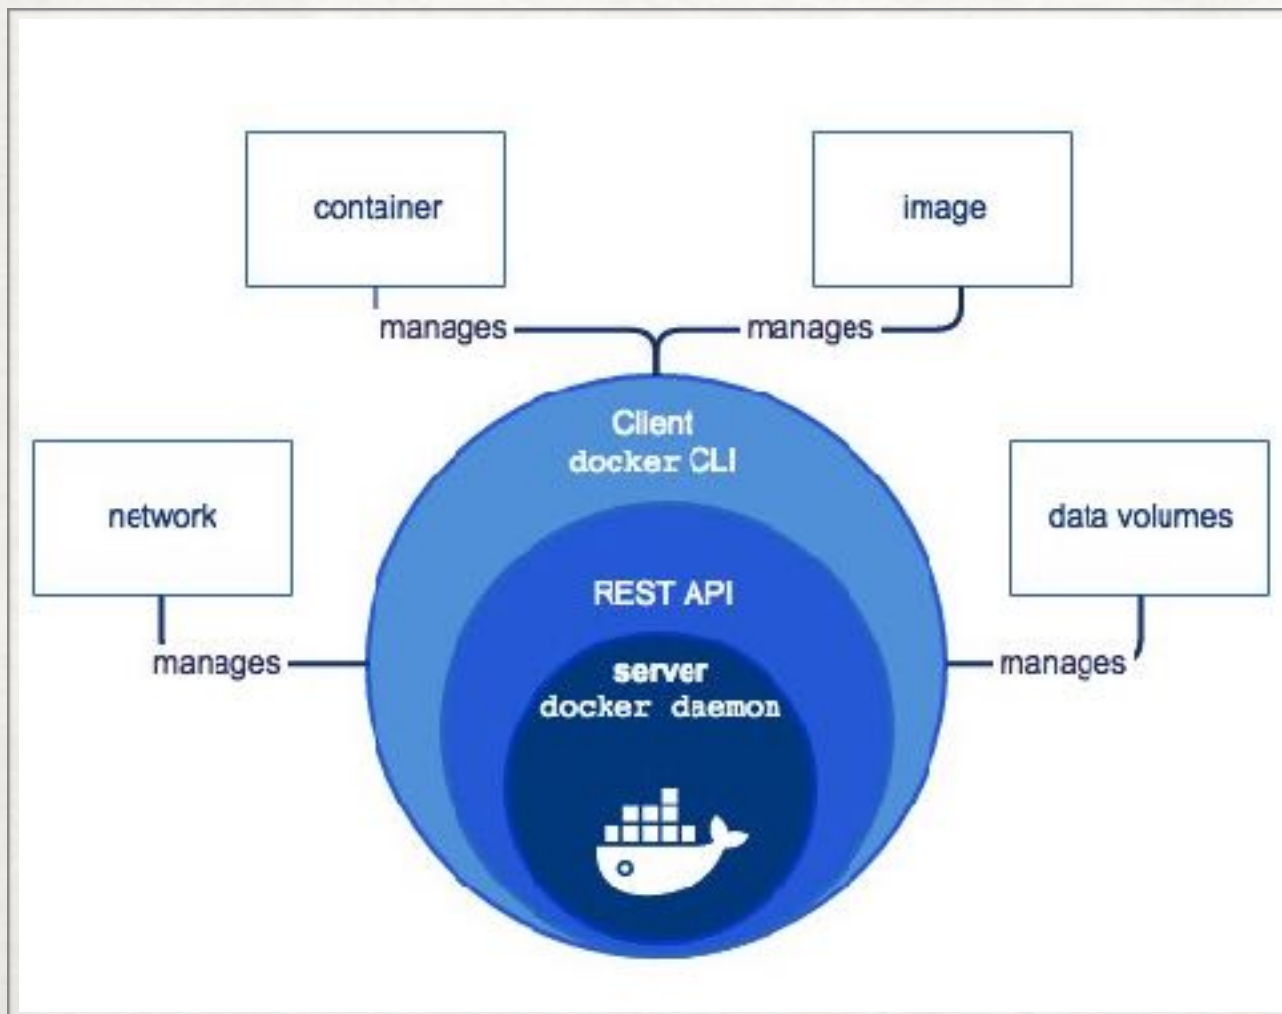

SORRY GUYS :(

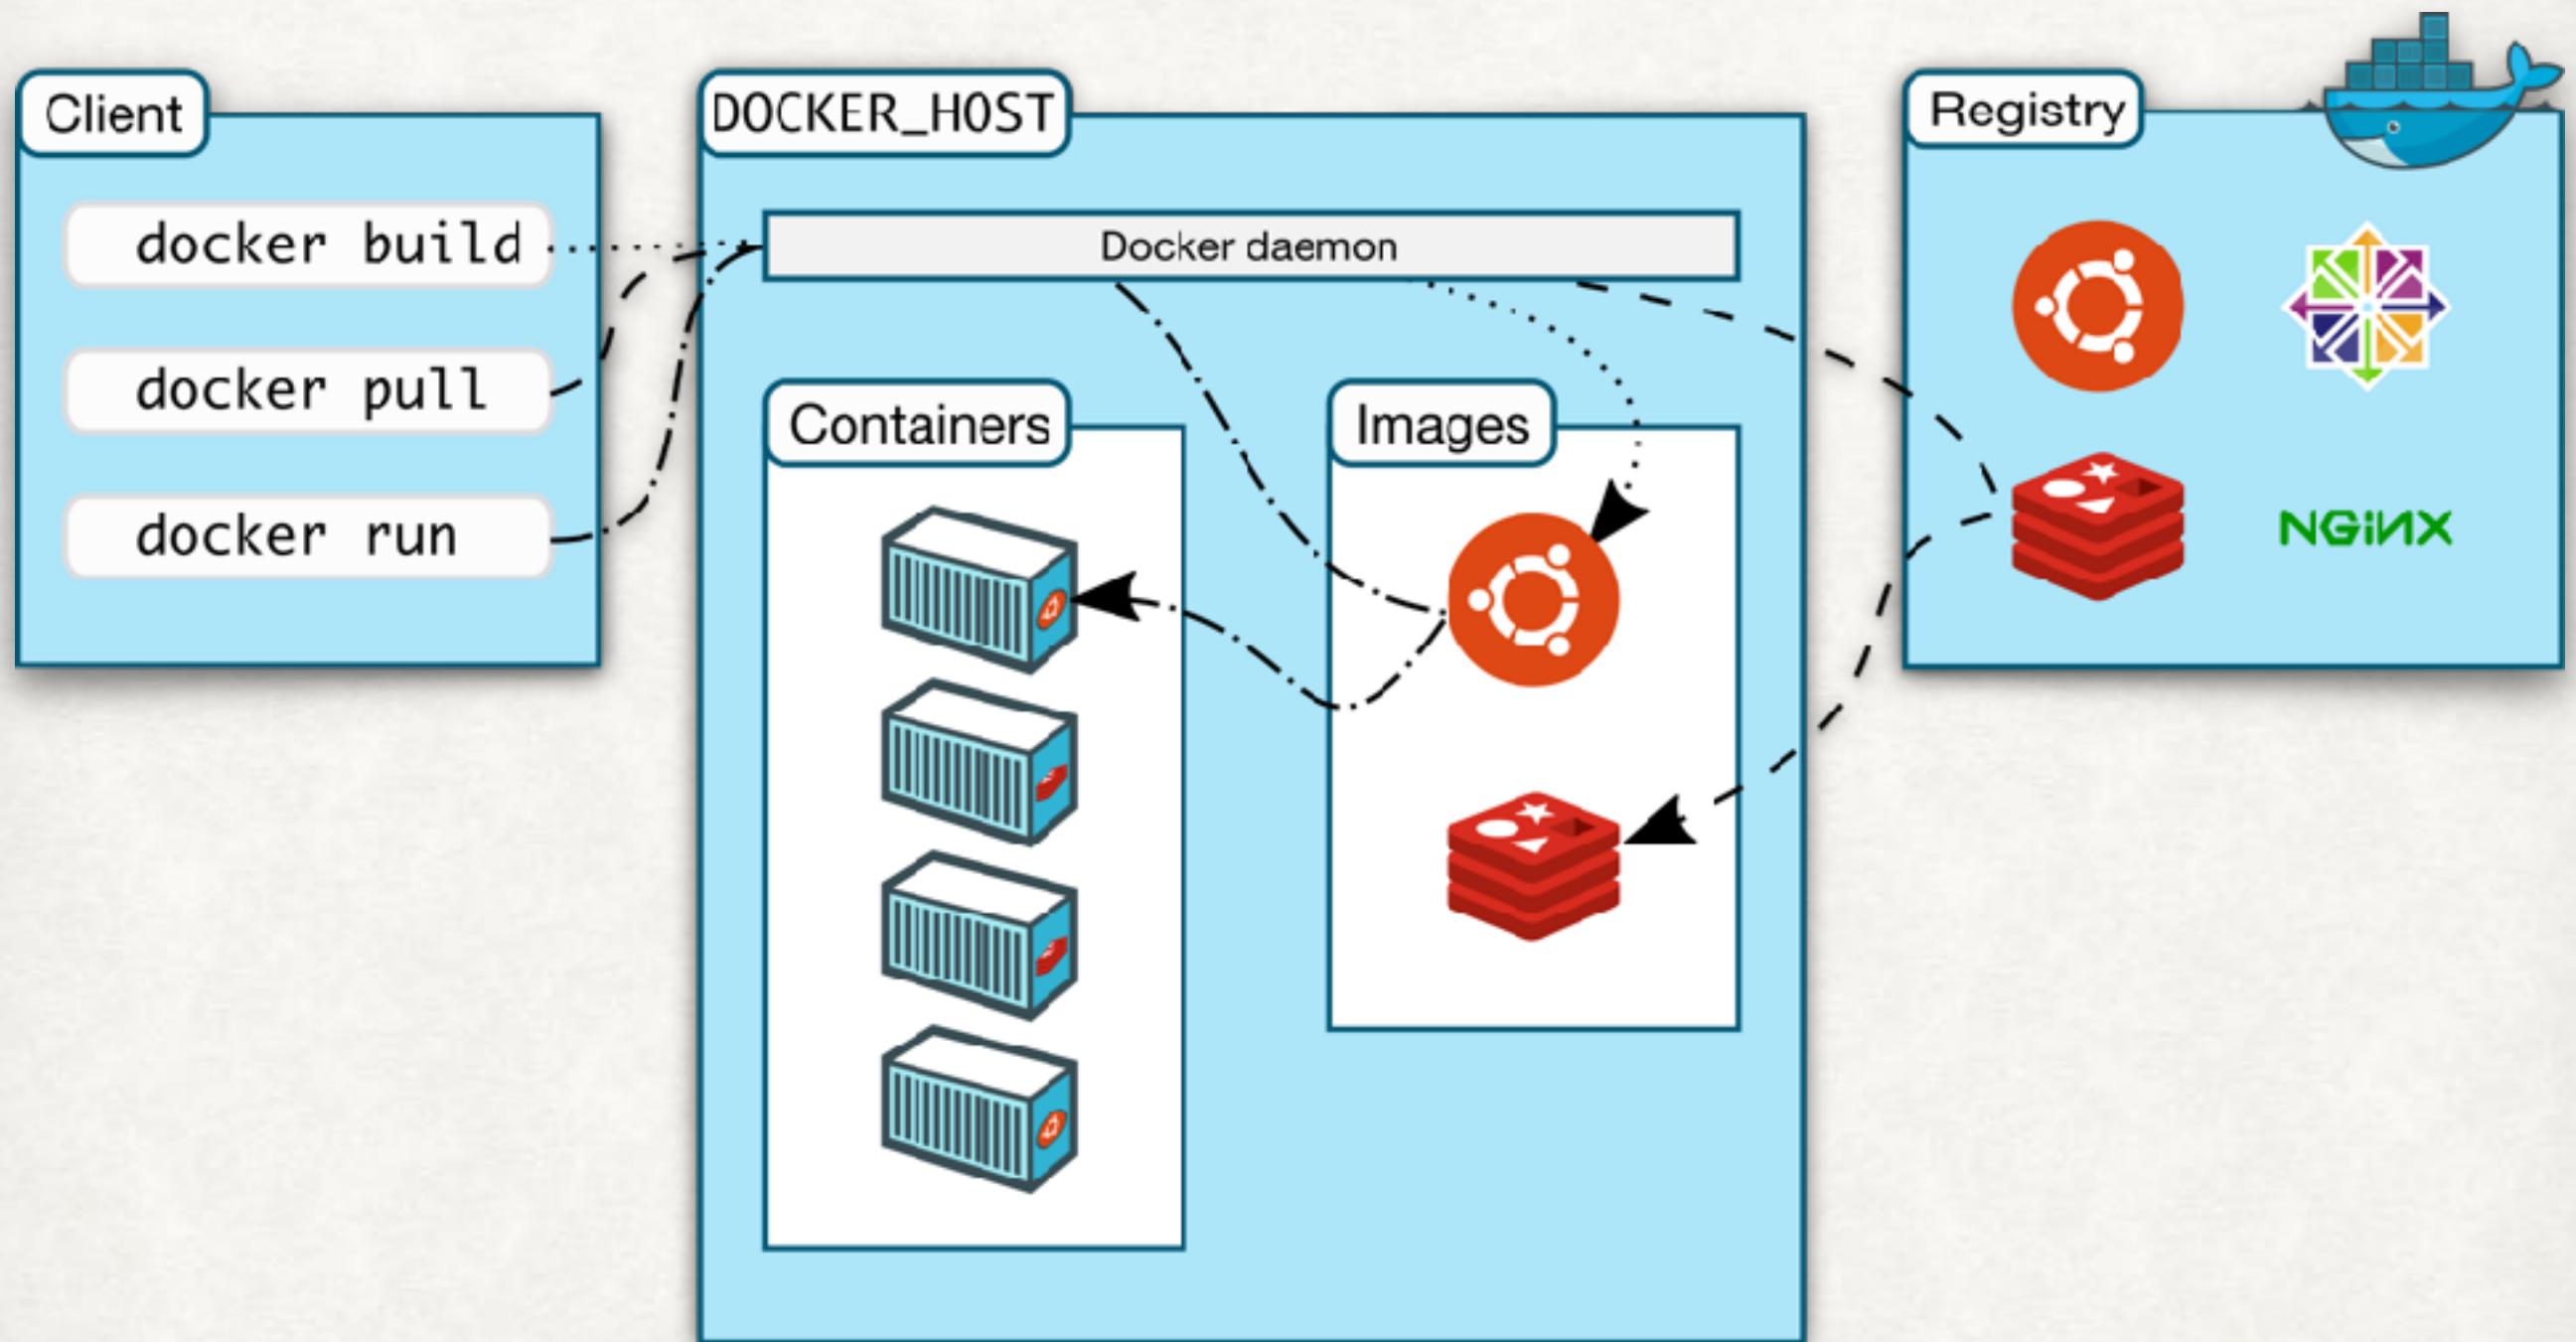

IT WORKED ON MY MACHINE.

ARCHITECTURE

- Docker Engine - is a client-server application, which contains:
 - a server (named **dockerd**) which actually is a daemon process
 - a REST API used to “talk” with the daemon process
 - a command line interface (CLI), named **docker**.

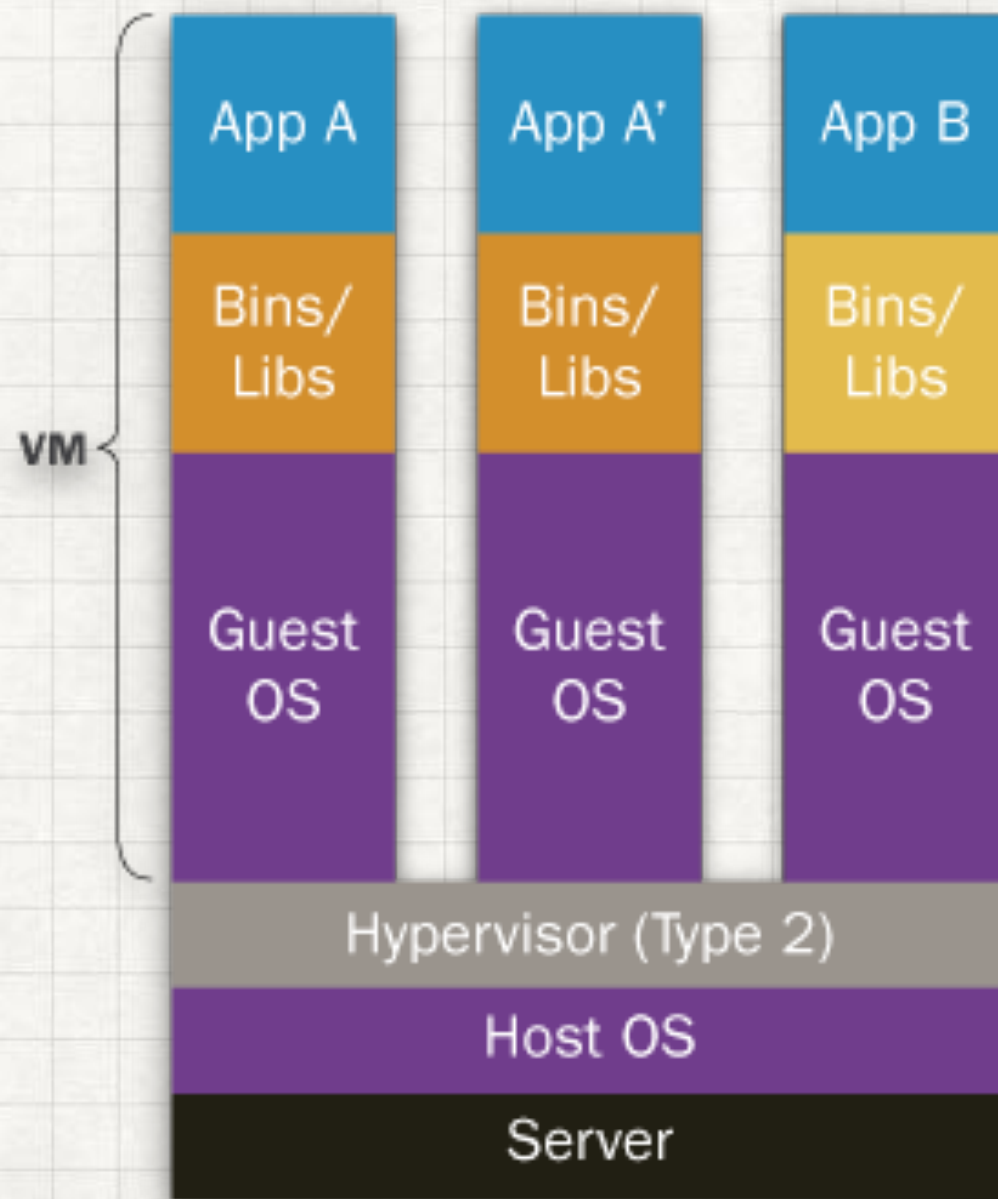

HOW IT WORKS?

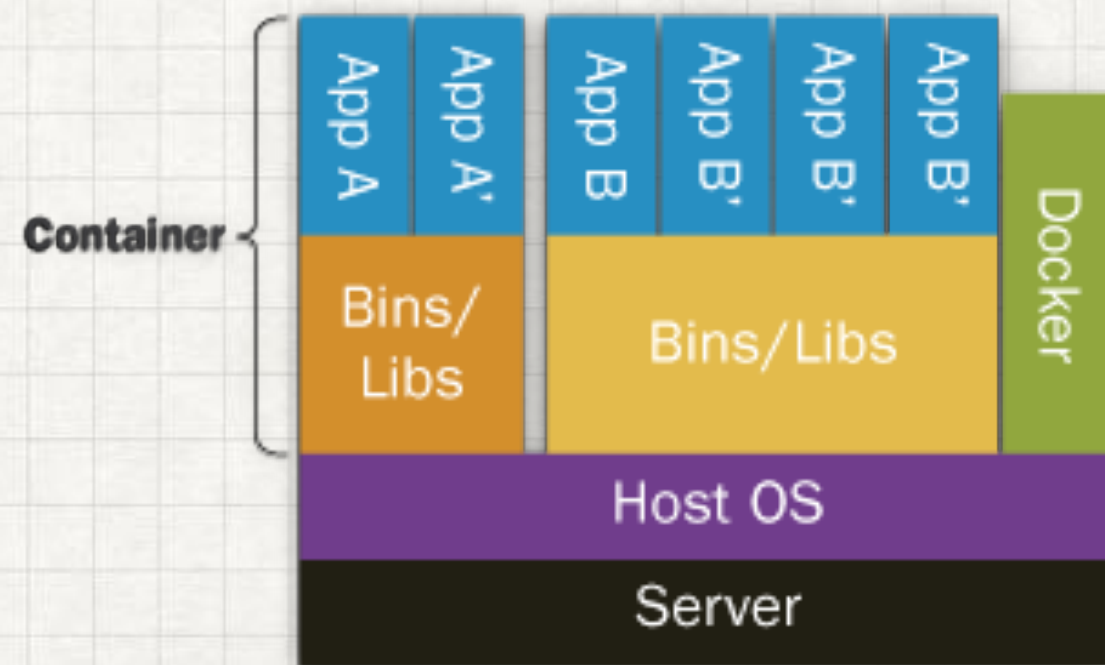

INNOVATION

Containers vs. VMs

Containers are isolated, but share OS and, where appropriate, bins/libraries

IT'S TIME FOR A DEMO
